

SHOTL

On-demand Mobility

Overview

Shotl is a mobility platform optimizing service with on-demand sustainable transport. Shotl makes public transit on-demand by providing dynamic routes and flexible schedules.

Feature

- We license our technology and empower transport operators, city councils, municipalities, corporations/business parks, airports to supply on-demand bus service.
- Shotl has 3 powerful applications working together: the passenger app, the driver app and the dashboard. All combined in an algorithm to provide the best route for each passenger where demand is, reducing the cost for the transport operator by 35% and multiplying the number of passengers.

Deployments

- Today, we have a total of 15 partners, and 24 operations running in 9 European countries and in Japan.

COVID-19 approach

- Our clients have a central console where they can see the operation in real time, passengers pickups and drop-offs, people on board, etc. so all data belong to them and they can manage the vehicle occupancy so they can guarantee social distancing onboard.
